

ABSTRACT

It is an object of the present invention to provide a curable composition for molding which contains a vinyl
5 polymer having excellent oil resistance, heat resistance, weatherability, etc., which can be cured by hydrosilylation, and which has improved mold release properties.

Specifically, the curable composition of the present invention contains the following four components as
10 essential components:

- (A) a vinyl polymer (I) containing at least one hydrosilylatable alkenyl group per molecule,
- (B) a hydrosilyl group-containing compound (II),
- (C) a hydrosilylation catalyst, and
- 15 (D) a metal soap.

As the metal soap, a metal stearate is preferable, and particularly, calcium stearate, magnesium stearate, or zinc stearate is preferable.
